

## Recommended torque value for March Scopes

- For scope rings  
15(inch pound)/1.7(newton meter) ~ 18(inch pound)/2.03(newton meter)  
We especially recommend 17(inch pound)/1.92(newton meter)
- For base attachment  
We recommend up to 30.9(inch pound)/3.5(newton meter).  
Torque above is the same for all March Scopes.

If the rings are close to the curve of the scope, it will also restrict the inner parts from moving. Rings should be placed in the red zone.
